Exploring Purchasing Intentions of Sustainable Food Products among Millennials and Generation Z in Indonesia

ABSTRACT

As Indonesia's largest import partner, Chinese sellers notice a shift in Indonesian consumers towards sustainable food. This research examines factors influencing purchase intention of sustainable food in Indonesia. Using a modified Theory of Reasoned Action model, six influencing factors were identified: environmental awareness, awareness about country regulations, family and friends opinion, media influence, attitude towards sustainable food products, and social pressure. Through a questionnaire survey, 301 respondents sampled from Indonesian Millennials and Gen Z are received. The results from Partial Least Squares Structural Equation Modeling (PLS-SEM) revealed a significant impact of environmental awareness and awareness about country regulations on attitudes and purchase intentions, and a significant impact of family and friends opinion and media influence on social pressure. However, the research cannot substantiate the impact of social pressure on purchase intention. Finally, this paper provides recommendations for Chinese sellers, local policymakers, and researchers in the field of sustainable food purchase intentions in Indonesia.

KEYWORDS: Purchase Intention, Sustainable Food Products, Millennials, Generation Z, International Food Market

研究印度尼西亚千禧一代和 Z 世代对可持续食品的购买意愿

摘要: 作为印尼最大的进口伙伴，中国销售商注意到印尼消费者正在向可持续食品转变。运用修改后的理性行为理论模型，发现了六个影响因素：环保意识、对当地法律法规的认知、家人和朋友的意见、媒体影响、对可持续食品的态度和社会压力。 通过问卷调查，我们收集了来自印尼千禧一代和 Z 世代的 301 名受访者的意见和看法。 偏最小二乘结构方程模型（Partial Least Squares Structural Equation Modeling/PLS-SEM）的结果显示，环保意识和国家法规意识对态度和购买意愿有显著影响，亲友意见和媒体影响对社会压力有显著影响。 然而，该研究无法证实社会压力对购买意愿的影响。 最后，本文为印尼的中国销售商、地方决策者和可持续食品购买意向领域的研究人员提供了建议。

Chapter 1 Introduction

1.1 Research Background

With 28.1% of all imports made by Indonesia in 2023, China is the nation's biggest trading partner (Badan Pusat Statistik, 2023). In addition to plastics, electronics, and machinery, China also exports food items to Indonesia. These food items consist of fruits, vegetables, sweets, and salts. Chinese marketers have been aware of Indonesian customers' recent shift toward sustainable food consumption. Shopping habits among Indonesian consumers are shifting toward greater environmental responsibility and health consciousness. Their dietary preferences and supermarket selections have also been impacted by this change in customer behavior. Healthy eating practices and a penchant for sustainable, environmentally friendly, and organic products are some of the food trends that Indonesian consumers are currently adopting.

The global food business has seen a notable movement in customer tastes toward more ecologically friendly and sustainable goods in recent years. This is mostly because people are becoming more conscious of the environment, demanding healthier options, and realizing the effects of environmental deterioration (Michaelidou & Hassan, 2008). Consumers have also been reminded of their health conditions by the recent global pandemic. According to studies, organic and other sustainable food products have lower pesticide residual levels compared to conventional food. Food that is organic is higher in nutrients and better for consumers' health and wellbeing. Hyland *et al.*'s (2019) study provides substantial proof that eating food that is organic lowers the consumption of chemicals associated with conditions including cancer, autism, and infertility in people. Buying organic food improves people's quality of life and supports environmentally conscious farming, claim Taghikhah *et al.* (2020).

Gano-an's (2018) study revealed a high degree of public acceptability, with consumers expressing no reservations about eco-friendly marketing initiatives. They even drew a significant interest towards the eco-friendly marketing initiatives. Among the key drivers of this shift are Millennials and Generation Z, two demographic groups renowned for their emphasis on ethical consumption, social responsibility, and environmental awareness. Individuals born after 1997, identified as Generation Z, came of age in an era characterized by climate change and significant environmental pollution. Generation Z, perhaps more than any other group, recognizes the impact of environmental awareness on their lives, prompting a desire for environmentally conscious consumption. Millennials, typically born between 1981

and 1996, grew up in an era where information became increasingly accessible through the internet. This made it easier to comprehend environmental problems and how they affect the entire world.

Many Chinese companies are implementing eco-friendly practices, integrating ethical sourcing, and creating products that are in line with environmental stewardship in response to the increasing request from Indonesian consumers for more ethical and environmentally responsible choices. This is in response to the growing demand for sustainable food production and consumption systems. The idea of sustainable development, which encompasses sustainable agriculture, was initially introduced by the United Nations in the 1990s. Sustainable food is a multifaceted term that considers environmental, social, and economic factors. By utilizing ecologically friendly agricultural methods that minimize chemical use, preserving the well-being of animals, lowering energy consumption, promoting public health, and aiding rural and urban populations, sustainable food products aim to pay attention to environmental, social, and economic impacts (Li & Kallas, 2021).

The fourth most populous country, Indonesia, is seeing rapid population expansion, which is increasing the demand for food. Food consumption is rising and accounts for a large percentage of all garbage dumped in landfills. Due to waste generation caused by this expansion, one-third of food products end up in the trash, contributing 1.3 billion tons of food annually on average. Such waste generation is a result of Indonesian customers' careless handling of food packaging in an attempt to make it more ecologically friendly and disregard for sustainable consumption. Consequently, adopting eco-friendly consuming practices is essential.

In order to understand Indonesian consumer’s shift towards sustainable goods, it is imperative to consider what variables impact the purchase intention of sustainable food products. Through an examination of Millennials' and Generation Z's purchase intentions, this study aims to clarify the critical elements affecting Indonesian buyer attitudes with regard to sustainable food items. After understanding the key variables affecting sustainable food products purchasing intentions among Millennials and Generation Z in Indonesia, the findings aim to inform strategies for Chinese sellers, local policymakers, and researchers to explore more about the Indonesian food market and increase Indonesian consumers’ purchase intentions towards sustainable food products.

1.2 Research Purpose and Significance

1.2.1 Theoretical Significance

As the social and environmental effects of food production and consumption become more widely recognized, scholars, decision-makers, and retailers are focusing more on sustainable food systems. While research on sustainable food products is conducted worldwide, the focus may vary depending on regional contexts, cultural norms, and environmental challenges. Research on sustainable food products in Indonesia is expanding. However, there is a lack of research on the purchasing intention of Indonesian Millennials and Generation Z. Therefore, this research aims to fill these gaps by exploring the purchasing intentions of sustainable food products among Millennials and Generation Z in Indonesia. The research's theoretical relevance stems from its ability to further established theoretical frameworks, particularly those pertaining to consumer behavior and sustainable consumption, adding new variables to the established research model by considering sustainable food consumption characteristics in Indonesia. Based on the literature review, four variables were added to the original framework of the Theory of Reasoned Action (TRA): environmental awareness, awareness about country regulations, family and friends opinion, and media influence. The study improves and broadens the theoretical framework of the Theory of Reasoned Action (TRA) by investigating how these variables indirectly influence Indonesian Millennials' and Generation Z's purchase intentions on sustainable food products through individual attitudes and social pressure.

1.2.2 Practical Significance

The significance of this research extends beyond academic discourse, aiming to offer practical implications for Chinese sellers, local policymakers, and researchers. In a market where consumer preferences are shifting toward sustainability, understanding the intricacies of what influences the choices of Indonesian Millennials and Generation Z becomes a strategic imperative for Chinese sellers. The overall objective of the research is to provide valuable insights for Chinese sellers focusing on Indonesia's food business by matching customer preferences with environmentally aware activities. The insights gained are anticipated to provide a foundation for Chinese sellers in the formulation of targeted marketing strategies, sustainable production practices, and programs that resonate with the values of these key demographic groups.

Secondly, local policymakers can benefit from the practical implications of this research by formulating regulations and incentives that promote awareness towards sustainable practices

within the food industry. The study gives local policymakers evidence-based insights into the variables driving consumer behavior, empowering them to create strategies that support both environmental conservation objectives and social values. The study's conclusions provide guidance to local policymakers on how to increase Indonesian consumers' knowledge of national rules and media impact to boost purchase intentions for sustainable food items.

Lastly, the research contributes to researchers in expanding the existing literature frameworks and creating space for further investigations in the future. By adopting quantitative approaches, the study systematically measures and analyzes the purchasing intentions of Indonesian Millennials and Generation Z. The aim is not only to contribute empirical evidence to the existing literature but also to provide actionable insights that can guide sustainable initiatives and practices in the Indonesian food industry. In the end, the research aims to be a significant contributor to the sector's shift to subsequent years that grows more socially and ecologically conscious.

Chapter 2 Literature Review

2.1 Introduction to Sustainable Food Products Concepts

Ecosystems are threatened by climate change, which also causes more extreme weather events, decreases biodiversity, and poses a threat to the human way of life in general. Ivanova *et al.* (2016) claim that domestic food consumption is responsible for over 60% of global greenhouse gas emissions and between 50% and 80% of all resource utilization. Therefore, changing people's dietary habits to be environmentally friendly is essential. The impact of the production and consumption of food on the ecosystem, society, as well as economy is a major concern in developed countries (Reisch *et al.*, 2013). By consuming less meat and more organic products, for instance, consumers might greatly increase the sustainability of their food intake. There are several ways to improve, and it's critical to consider both the amount eaten and the sustainability of the manufacturing process (Hoogland *et al.*, 2005). From the standpoint of the consumer, two wide behavioral approaches for sustainable consumption of food can be identified: sustainable dietary patterns and sustainable product choices, which are related to the composition of the diet and consumption reduction (decreased quantity) within the category of product (e.g., consuming less meat). Selecting sustainable products has to do with how they are made (e.g., organic, free-range, or fairly traded items). The question of how these behavioral techniques should be promoted and used, as well as how they could be comprehended, is crucial.

Businesses have a stake to create "the healthy choice the easy choice more often" through creating and promoting nutrient-dense goods that are aesthetically pleasing, feel indulgent, and are easy to prepare. Examples of these products include premium traditional foods, fruit and vegetable drinks, margarines fortified with phytosterols, bread with a high phyto-estrogen content, and staple foods enhanced with vitamins or micronutrients. Customers should be able to make educated dietary decisions by having access to accurate and enlightening labeling and nutritional information, such as from carelines, websites, and in-store pamphlets. A research by Riskos *et al.* (2021) found that ecolabel legitimacy positively influences attitudes about buying green items.

An effort to establish a food system that is accountable for the environment, society, and economy include both sustainable food items and a sustainable food supply chain. In addition to making sure everyone will get a source of healthy meals including reliable data regarding

the foods they eat, a sustainable food supply chain also ensures that secure, healthful foods are produced to cater the marketplace needs (DEFRA, 2002). It uses renewable energy sources whenever available, minimizes resource inputs, and reduces energy consumption to continually meet high criteria of environmental performance. High levels of social welfare, a hygienic and safe workplace, and social worker development are all ensured by sustainable food supply chains.

While buying products made sustainably is a positive beginning, there are other ways to consume food more sustainably as well (Garnett, 2011; Baroni *et al.*, 2007). One of the most important ways to lessen the environmental effect of one's diet is to consume fewer items that have significant environmental costs (Foresight, 2011). This strategy's key component is the substitution of items with lower sustainability impacts from other product categories (or no substitution at all, which results in a drop in overall food intake) for products in unsustainable product categories. The benefits of eating an eating plan that is greater in foods made from plants and less in foods made from animals are widely known since animal-based commodities, especially dairy products and meat, are resource-intensive (Baroni *et al.*, 2007). One of the most crucial suggestions for consuming food in a more sustainable way is to consume less meat. In order to provide people with a wholesome and diverse diet all year long, food conservation is essential.

2.2 Theory of Reasoned Action (TRA)

The Theory of Reasoned Action (TRA) is used in this study to examine Indonesian consumers' intentions to purchase sustainable food items. A behavioral psychology theory known as the Theory of Reasoned Action (TRA) was developed within 1967 by Martin Fishbein and Icek Ajzen. To explain and predict people's behavior, the idea is based upon attitude and subjective norms. According to TRA (Ajzen & Fishbein, 1980), an individual's motivation to engage in a certain activity has a major role in deciding whether they will actually engage in that action. According to Glanz *et al.* (2015), TRA makes the assumption that people make logical decisions and weigh the pros and drawbacks of their choices before acting. The theory of reasoned action, defined by Thompson *et al.* (1994), examines intentional, voluntary, and methodical conduct (Fishbein & Ajzen, 1975). These are the actions that the person has influence over. According to the hypothesis, an individual is more likely to have a strong desire to undertake the action and, thus, increase their possibility of engaging in it if they have a good

attitude toward the activity and believe that others who are important to them expect them to carry it out (Dillard & Pfau, 2002).

For instance, a customer's true intention to place an order at a restaurant before their friends come may depend on their views regarding the suitability (perceived interpersonal norm) of placing an order in a particular circumstance, as well as their desire to conform to those expectations. This is true even though the customer may feel positively about ordering first at the restaurant. The Theory of Reasoned Action has been extensively utilized in many domains, such as consumer behavior, health psychology, and communication studies, to comprehend and anticipate human conduct in diverse situations (Fisher *et al.*, 1995; Peslak *et al.*, 2010). Subjective norms and attitudes toward the conduct are two major elements that shape behavioral intentions, according to the Theory of Reasoned Action.

Figure 2.1 Theory of Reasoned Action

Data source: Fishbein and Ajzen (1975)

An individual's attitude is defined as their positive or negative evaluation of being involved in a specific behavior (Armstrong & Kotler, 2009). It is influenced by the individual's opinions of the behavior's effects as well as their overall judgment of those outcomes. Subjective norms, according to Fishbein and Ajzen (1975), constitute the perception of societal influence or pressure to partake in a certain action or abstain from it. It comprises attitudes about what significant others—like friends, family, or coworkers—think one should do and the drive to follow their views.

In earlier research on consumers' intentions around food purchases, the TRA was frequently employed. The meta-analysis conducted by Sheppard *et al.* (1988) confirmed the Theory of Reasoned Action's (TRA) prediction effectiveness. It reliably forecasts individual behavior in the majority of instances, particularly when the behavior is intentional rather than obligatory.

Regarding sustainable food items, attitudes imply people's general assessments of consuming these goods. Purchase intentions are more likely to be good when attitudes are positive. Subjective norms are the idea of societal pressure and acceptance for a certain action.

For sustainable food products, this involves understanding the influence of family, friends, and societal norms on the participants' intentions to buy sustainably. Investigating the role of social influences within Indonesian culture will provide valuable insights into how subjective norms impact the purchasing intentions of Indonesian Millennials and Generation Z. This study will investigate possible independent factors which might affect the link among attitudes, subjective norms, and purchase intentions in addition to the basic TRA components. To give a more comprehensive view of how decisions are made, variables including people's opinions, awareness of national rules, eco-consciousness, and the effect of digital media will be taken into account.

2.3 Research on the Factors Influencing Consumer Purchase Intention on Sustainable Food Products

What food customers choose to buy is influenced by a variety of variables, including the impact that specific methods for processing food have on the surroundings and the health of the consumer. The sort of green product that is looked at as well as the inherent nature and level of engagement in the food category are factors which largely influence the behavioral intentions of buyers (Rahman, 2018). Individual attitude plays a significant impact in influencing purchasing intention before subjective norms.

Since the turn of the century, studies have been done on consumer attitudes regarding and consumption of food items produced sustainably (Annunziata *et al.*, 2011). Research on customers' preferences for organic products, particularly, has been conducted extensively (Lockie *et al.*, 2004). The food research lists an extensive number of factors that influence customers' decisions to buy sustainable products, such as societal and personal standards, awareness of food sustainability, and favorable attitudes toward sustainable food. Incorporating food choice incentives enhances the explanation of sustainable food choices, going beyond widely used theories. Health, environmental, naturalness, and flavor concerns influence the decision to purchase ecologically friendly items, even if cost, perceived time restrictions, misunderstanding of the environmental consequences of food, and accessibility may function as obstacles to the buying of sustainable foods. Media can create higher environmental concern among consumers (Trivedi *et al.*, 2018).

Research investigating the connection between sociodemographic traits and the purchase of organic food indicates that women are more inclined than males to make this type of purchase (Aertsens *et al.*, 2009). Functional, social, and environmental values positively impact

consumer choice behavior for organic food (Vindigni *et al.*, 2002), while conditional and epistemic values have the opposite effect (Khan & Mohsin, 2017). Chang and Chang (2017) show that the likelihood of organic customers to regularize and receive informational intersubjective impacts is favorably influenced by the strength of the link and the environmental competency of both parties involved.

According to Garcia and Teixeira (2017), the high cost of environmentally friendly products is merely caused by non-food safety-related factors (pollutants from natural and green sources and microbiological reliability are heavily influenced by additional variables rather than being completely unrelated to the manufacturing system). Reinders and Bartels (2017) found that brand equity of national brands, whether private label or organic, has a substantial impact on consumers' non-chemical consumption behavior and their consumption of additive-free goods. When it comes to private label organic products, non-chemical consumption patterns and additive-free brand consumption are linked to brand recognition. Consumer identification that prioritizes the environment has an effect on national organic brands' non-chemical consumption behavior and brand consumption that is additive-free. The association between brand value and additive-free brand buying is moderated by brand familiarity.

Konuk (2018) observes that the demand for foods that are organic is rising swiftly as customers' worries about the environment and their health become more important when making selections. When it comes to organic food, price equity, satisfaction, confidence, and purchase intentions are all positively correlated. Juhl *et al.* (2017) discovered that consumers gradually broaden their sourcing of organic products to include a variety of product categories and accept organic food goods in a predictable, nonrandom order. A customer who chooses to buy non-chemical items is prone to develop an overall preference for organic food and environmental responsibility, and that in turn motivates them to look into other types of food that is free of additives. To better understand the factors influencing purchase intentions of sustainable food products in Indonesia, the author has reviewed the latest research in this area. The results are summarized in the following table.

Table 2.1 A summary of recent studies of purchase behavior towards sustainable food products in Indonesia

No.	Authors (year)	Dependent Variable	Independent Variable	Empirical Findings
1	Saberina and Aprianti (2022)	Consumer Actual Purchase of Organic Foods	- Knowledge - Health Consciousness - Attitude toward Organic Food	The study results demonstrate that the knowledge and health awareness variables are significantly positively impacted by the attitude variable about organic foods. It has also been demonstrated that the inclusion of knowledge and health awareness factors can moderate the attitude variable toward the buying interest variable, which results in actual purchases.
2	Li and Kallas (2021)	Consumers' Willingness to Pay (WTP) for Sustainable Food Products	- Gender - Region - Sustainable Attributes - Food Categories	The results show that, on average, there is a 29.5% WTP premium on sustainability. Additionally, the average WTP estimations and their variation are influenced by food categories, geographical location, gender, and sustainable features.
3	Chen *et al.* (2021)	Consumer Willingness-to-pay Value for a Sustainable Consumption Transition Model	- Social Concerns - Waste Minimization - Economic Consideration	The findings indicate that social concerns and attitudes on waste reduction are the main drivers of sustainable consumption patterns, in which health-related products, sustainable issues, and ethical waste disposal have a major effect on the willingness to pay (WTP) of customers.

Table 2.1 A summary of recent studies of purchase behavior towards sustainable food products in Indonesia (Continued)

4	Simeone and Scarpato (2020)	Sustainable Consumption	- Social Media Information - Environmental Awareness	The research claims that homogenized consumerism, which is often a mentality that is detrimental to the environment, is a result of social media.
5	Najib *et al.* (2021)	Purchase Intention for Organic Food	- Social Factor - Cultural Factor - Personality - Psychological Factor - Attitude towards Organic Food	The findings demonstrate the strong influence of social, cultural, personal, and psychological aspects on consumers' perceptions of organic food. Furthermore, the intentions of middle class consumers to purchase food that is organic are positively influenced by attitudes.
6	Fannani *et al.* (2020)	Organic Food Literacy and Purchase Intention	- Social Media - Components of the AISAS Model	The results of the study demonstrate how social media greatly and positively impacts customer focus, curiosity, and searching parameters.
7	Hasan and Suciarto (2020)	Organic Food Purchase Intention	- Attitude - Subjective Norm - Perceived Behavioral Control	The study's findings support the following conclusions: buying intention for organic food is strongly influenced by attitude to organic food, perceived behavioral control, and subjective norms.
8	Kartawinata *et al.*(2020)	Green Product Purchase Intention	- Consumer Attitude - Green Marketing Mix	The findings showed that in West Indonesia, consumers' attitudes and the green marketing mix both positively influenced their propensity to purchase green products.

Table 2.1 A summary of recent studies of purchase behavior towards sustainable food products in Indonesia (Continued)

9	Fabiola and Mayangsari (2020)	Green Purchase Intentions	- Green Skepticism - Environmental Knowledge - Environmental Concern	The study's findings indicate that while environmental awareness and concern have significant and beneficial effects on green purchase intention, green skepticism has a little negative impact.
10	Dangi *et al.* (2020)	Purchase Intention	- Attitude - Subjective Norms - Perceived Behavior Control	The results show that belief in the organic certification mark, knowledge, cost, past purchasing history, and health concerns are the main drivers of organic product purchases.
11	Lestari *et al.* (2020)	Consumer's Purchase Intention	- Attitude toward Green Products - Eco-label - Environmental Concern - Peer Pressure	The findings of this study demonstrated that peer pressure, environmental concern, and eco-label had a considerable favorable influence on views toward green products. Additionally, customer intentions to buy green items were positively impacted by attitudes about them.
12	Indriani *et al.* (2019)	Green Purchase Intention	- Environmental Knowledge - Green Brand Image - Attitude Towards Green Products	The study's conclusions demonstrate that customers' inclinations to purchase ecologically friendly goods are significantly influenced by their level of environmental knowledge.

Table 2.1 A summary of recent studies of purchase behavior towards sustainable food products in Indonesia (Continued)

13	Tan *et al.* (2016)	Consumers' Purchase Intention toward Green Products	- Product Perception - Green Stigma - Perceived Sense of Responsibility - Readiness to be Green	The findings suggest that product perceptions, green customers, and green actions don't have to conflict with one another in order to have an impact on consumers' green behavior; rather, they can overlap and have different degrees of influence.
14	Suprapto and Wijaya (2012)	Purchase Intention	- Healthy Consumption Lifestyle - Attitude Toward Organic Food	According to the research, leading a healthy lifestyle is an excellent way to gauge how you feel about organic food, and how you feel about it directly affects how likely you are to buy organic food.

An analysis of prior research indicates that several studies have looked at the purchasing behavior of sustainable food products, but there's a lack of focused research on the purchasing intentions of sustainable food products specifically among Indonesian Millennials and Generation Z. In Indonesia, Millennials and Generation Z are pivotal in reshaping food market dynamics due to their emphasis on ethical and environmentally conscious choices. Understanding the factors guiding their choices and the barriers they face is crucial. By investigating these groups' choices and reasons with relation to sustainable food items in Indonesia, this research aims to close this information gap.

2.4 Research on the Purchase Behavior of Millennials and Generation Z

Given that this study focuses on millennials and generation Z's purchase intentions, it's critical to comprehend these groups' purchasing habits from prior research. In the context of this study, people born between 1981 and 1996 are referred to as millennials. Other names for this generation include Generation Y and the Echo Boomers. The millennial generation is the one with more financial restraints in the post-recession period. Due to their size, they are viewed as a sizable and alluring market both now and in the future. They also experience greater rates of unemployment and debt. Yaz (2016) asserts that Millennials are a collaborative,

creative, and enterprising generation that will shape the global luxury market in the next few years. This generation was born into a world where technology was still in its infancy (Omar, 2016).

Since they were the initial group who grew up with mobile devices and the worldwide web, millennials have adopted technology as a way of life and don't merely tolerate it (Kotler & Armstrong, 2012). Millennials typically don't give as much thought to the political or economic conditions in their community. Millennials have greater social media connections. As a result, people exchange goods, restaurants, and shopping locations with others and actively and sensibly offer advice. Even though the pricing is very high, they consistently prioritize the quality first.

Millennials are shifting their attention from traditional media to newer, more interactive forms of content, which they typically discover to be both entertaining and useful (Rahman, 2015). Millennials are drawn to digital marketing strategies that use graphics, personalization, competitive pricing, and affordable shipping (Smith, 2011). When it comes to social impact, Millennials constantly look to their peers to judge a product's worth. According to Weyland (2011), organizations that possess strong principles, social ethics, unique brands, and non-hierarchical settings tend to attract Millennials more than others. Valentine and Powers (2013) found that this generation prefers not to be the focus of advertisements, therefore when making decisions about what to buy, they rely more on friend recommendations and electronic word-of-mouth (eWoM) marketing.

Gen Z is the generation that comes after the Millennials, also known as Post-Millennials, iGeneration, NextGen, or Gen Wii. In this study, the generation born between 1997 and 2012 is referred to as Generation Z. Generation Z has never experienced a world without social media or a cell phone because these technologies have always been readily available to them (Kebritchi & Sharifi, 2016). Because of their improved fine motor skills, they can handle a phone or tablet. For this reason, they are thought to be the generation with the most technological know-how. Generation Z does not care about diversity; rather, they will only notice it lacks. Having grown up in an era when the number of bi-racial and minority individuals has increased dramatically, they are more diverse themselves. Young members of Generation Z may place a high value on savings due to their family's financial troubles, which may have increased their awareness of the worth of money.

Because they grew up in a war-torn environment, younger generations may believe that the globe is "unsafe," yet they may also be more aware of the world at large (Rehman, 2017). A

generation that may prioritize financial responsibility, tolerance for others, education, job flexibility, and networking skills is the product of these repercussions. There have been attempts in the past to evaluate some facets of Gen Z buying habits, such as their views and expectations, as well as potential long-term consequences of such expectations on the retail industry. Payment choices, enjoyment factor, peer and social influence, product design, and product brand are the main determinants of Gen Z's purchasing decisions.

Generation Z are the market experts with a wealth of information and customer understanding of numerous industry aspects attributed to their cognitive prowess and social media networking. Shoppers in Generation Z are developing previously unheard-of tastes and habits. The most traditional influencing elements, like product attributes, cost awareness, and referrals from relatives, have a big impact on this generation's shopping behaviors. Nonetheless, new studies show that Generation Z's purchase decisions are influenced by social media identification, peer and social influence, and computer literacy. According to Thangavel *et al.* (2019), Gen Z customers are primarily motivated by two shopping orientations: value consciousness and convenience.

A 2017 Accenture survey found that Gen Z consumers are more impacted by social media than Millennials are, and they frequently base their decisions on three things: user evaluations, the merchandise's appearance, and the best offer or lowest price. Additionally, it was found that before making a purchase, individuals were placing greater value on advice from friends and family. In addition, Seemiller and Grace (2017) pointed out in their study that while Millennials and Generation Z share specific features, they are two quite separate generational cohorts with distinctive characteristics of their own.

2.5 Summary of Literature Review

Chapter 2 summarizes literature related to sustainable food products concepts, the Theory of Reasoned Action, the factors influencing consumer purchase intention on sustainable food products, and the purchase behavior of Millennials and generation Z, forming the theoretical basis of this paper. Initially, the concept of sustainable food products was introduced, as many people might still be unfamiliar with this concept. Consequently, the underlying theory of this research, Theory of Reasoned Action (TRA), is explained along with previous researches using this theory. Furthermore, the author discovered the research gap by reviewing research on the factors influencing consumer purchase intention on sustainable food products. Although many previous research already focused on the influence of the variables attitude and subjective norm

on consumer purchase intention, there is a lack of research on the indirect influence of awareness about country regulations on the purchase intention of Indonesian Millennials and Generation Z in Indonesia towards sustainable food products.

Literature review on the research of the Millennials and Generation Z's purchase behavior provide insights of the variables that greatly affect their purchase intention. As Millennials and Generation Z are technology-savvy generations and take account of their surroundings' opinions, the author added the variables family and friends opinion and media influence. Compared to other generations, these generations are also known to be aware of environmental issues, thus adding the variable environmental awareness into account. Finally, this research will further explore the influence of the individual attitude related factors: Environmental Awareness and Awareness about Country Regulations, and social norm related factors: Family and Friends Opinion and Media Influence to the purchase intention of Indonesian Millennials and Generation Z towards sustainable food products using the Theory of Reasoned Action.

Chapter 3 Theoretical Framework

3.1 Variable Selection and Description

The primary focus of this study is the dependent variable, or the consumer's desire to create a decision to buy. To ensure a comprehensive exploration, the choice of independent variables is informed by an extensive review of existing literature. This comprises an analysis of the unique attributes that define Indonesia's sustainable food sector, as previously noted in studies on the nation's propensity to purchase sustainable food items. From a myriad of influencing factors, six independent variables were deliberately chosen for their research significance. These variables encompass environmental awareness, awareness about country regulations, the influence of family and friends' opinions, media impact, individual attitudes towards sustainable food products, and social pressures. The researcher intends to provide a comprehensive study of the complex dynamics influencing customer buying intentions in the framework of sustainable food items in Indonesia by delving into the subtle effects of each of these chosen independent factors on the dependent factor.

3.1.1 Environmental Awareness

Environmental awareness, according to Harju-Autti and Kokkinen (2014), is the state of knowing about and being conscious of the surroundings in which individuals exist while actively contributing to the development of environmentally conscious communities. A society's behavior toward the environment is greatly influenced by its degree of environmental awareness. Due to the numerous environmental issues that every nation faces, environmental awareness is being researched in many different nations. In many nations, pro-environmental attitudes and awareness are regarded as crucial results of science education (Alves *et al.*, 2009). Science education is important for fostering an awareness of the scientific theories that underpin environmental issues. This study will look at how attitudes toward sustainable food items are affected by environmental awareness.

3.1.2 Awareness about Country Regulations

Achieving sustainable development requires all-encompassing strategies that incorporate actions related to production and consumption (Bebbington & Unerman, 2018). In the journey towards a sustainable future, the government plays a pivotal role. Through the formulation of regulations, the government actively promotes sustainable consumption and production, pinpointing deficiencies in national schemes that may diminish their overarching impact. This

research seeks to delve into the intricate dynamics of how individuals' awareness of country regulations, particularly those related to sustainable food products, influences their attitudes toward sustainable food products.

3.1.3 Family and Friends Opinion

Family is the group that has the biggest influence on a person's inclination to purchase goods. People usually have opinions about the things that are important to them within a circle of friends or coworkers, and those opinions affect other people's thoughts and points of view. According to earlier studies, the opinions of friends and family are frequently taken into account as external environmental factors influencing sustainable consumption. The reference groups—friends and family, for example—that affect consumers' willingness to purchase organic items were identified by Roberts and Rundle-Thiele's (2007) study, but the exact amount and direction of these groups' effect could not be ascertained. Thus, the purpose of this study is to comprehend how family and friends' perspectives affect perceived social pressure.

3.1.4 Media Influence

People's behavior as consumers is greatly influenced by the media, and the thoughts and actions of individuals are influenced differently by various media outlets. A few instances of media influence include blogs, television shows, social media, traditional and digital advertising, and social media. Both good and negative effects of social media use on purchasing habits and understanding of sustainable consumption are possible. Zhang *et al.* (2019) claim that social media, particularly social networks, are becoming more and more well-liked platforms for exchanging information, including culinary-related information. Social media is used to provide people with more food options, recipes, or consumed food, and, occasionally, to confuse people about what to eat. Understanding whether the media influences societal pressure to buy sustainable food items is the aim of this research.

3.1.5 Attitude towards Sustainable Food Products

A prior study (Rigby & Cáceres, 2001) found that although consumers do not agree on the definition of a sustainable product or whether organic products are sustainable, they do cognitively perceive organic food products that have received internal eco-friendliness certification as being more environmentally friendly than conventionally produced food products. Organic goods have long been seen as advantageous for both individual health and the environment. As a result, customers expect organic products to be both healthy and

ecologically beneficial and view them as respectable products. Hughner *et al.* (2007) report that most consumers are positive about purchasing food that is organic, and some even do so often. The researcher used quantitative research to examine if Indonesian customers' intentions to purchase sustainable food goods are influenced by their attitudes about such products.

3.1.6 Social Pressure

Consumers are not autonomous, atomistic decision-making machines. Each person's social groups provide a frame of reference that influences how they behave. Numerous empirical (Curran *et al.*, 2009) and theoretical (Janssen & Jager, 2001) research emphasize the role of social factors on consumption. Less attention has been paid to how specific social groups affect how consumers behave when it comes to sustainable items. This research extends existing research by focusing on the impact of social pressure towards purchase intention of Millennials and Generation Z in Indonesia.

3.1.7 Purchase Intention

According to Rashid *et al.* (2009), purchase intention for sustainable food products refers to a consumer's capacity and intention to use their preference for sustainable food products rather than regular foods when making considerations and assessments during the purchasing process. Purchasing intentions for sustainable food goods are often associated with favorable product reputation and a readiness to pay a premium compared to conventional products. In this research, the impact of several independent variables towards Indonesian consumers' purchase intentions is being studied.

3.2 Research Model and Hypotheses

This research modifies the Theory of Reasoned Action (TRA) to analyze the purchasing intention of sustainable food products among Millennials and Generation Z in Indonesia with consumer attitudes and social pressure as its independent variables. While TRA separates intention and behavior as different variables, this research chooses one variable, that is Purchase Intention, as a dependent variable which best predicts future behavior (Ajzen, 1985, 1991; Ajzen & Madden, 1986). The current study revises the findings of Setyawan *et al.* (2018), which attempted to incorporate novel concepts, environmental knowledge, and environmental concern as influencing factors of attitude. It then adds environmental awareness and awareness of national legislation. Instead of using Subjective Norm, the author uses the term Social Pressure that comprises Family and Friends Opinion and Media Influence as its influencing

factors. Six proposed hypotheses that have varying effects on Indonesian consumers' purchasing of sustainable food items are included in the study paradigm depicted in the figure below. The research consists of seven variables studied, namely environmental awareness, awareness about country regulations, attitude towards sustainable food products, family and friends opinion, media influence, social pressure, and purchase intention.

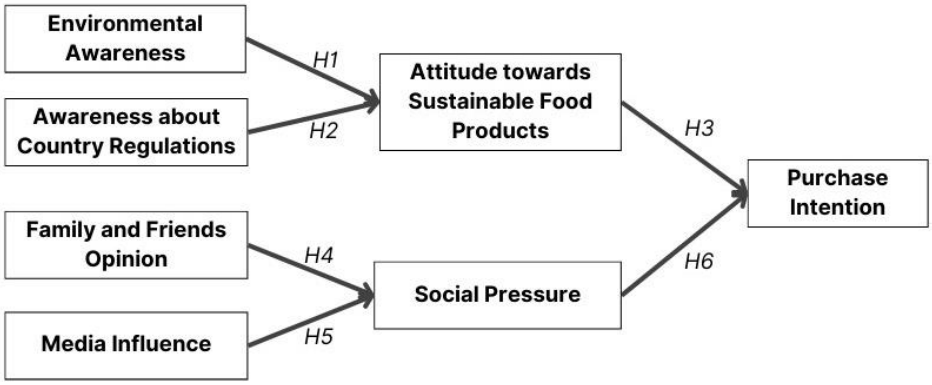

Figure 3.1 Proposed Research Model

3.2.1 Environmental Awareness and Consumer Attitude towards Sustainable Food Products

The degree of attention, comprehension, and care that people or communities have for environmental problems, sustainability, and conservation is referred to as environmental awareness. It represents knowledge and acceptance of environmental problems such as pollution, depletion of resources, loss of biodiversity, and global warming. Compared to other generations, millennials and generation Z exhibit a greater degree of environmental knowledge and care (Dwidienawati *et al.*, 2021). These generations understand that the products they purchase directly affect the environment. Environmental awareness is known to be the force behind the purchasing decision of sustainable food products. It can be said that this variable (environmental awareness) plays a strong role in influencing consumer attitudes towards purchasing sustainable food products in Indonesia. Higher environmental knowledge among buyers is often associated with more favorable sentiments about the purchasing choice (Indriani *et al.*, 2019). It becomes vital to assess how complex and deep this relationship is. Therefore, the first hypothesis was developed:

H1. **The level of environmental awareness among Millennials and Generation Z in Indonesia positively correlates with their attitudes towards purchasing sustainable food products.**

3.2.2 Awareness about Country Regulations and Attitude towards Sustainable Food Products

Another variable that affects consumers' green purchase attitude is the awareness about country regulations. Sustainable consumption of food is an important worldwide concern (Ariani *et al.*, 2022). In order to continually preserve the benefit for current and future generations, the Indonesian government created the Environmental Protection and Management Law No. 32/2009. It pertains to governmental assurances in the legal realm aimed at safeguarding the environment, particularly in preventing ecological harm caused by extensive exploitation of Indonesia's natural resources. High awareness about country regulations in practicing sustainable development goals (SDG) will lead to a higher environmentally-friendly attitude. Subsequently, the author hypothesize that:

H2. **The level of awareness about country regulations pertaining to sustainable food production and consumption positively correlates with Indonesian Millennials and Generation Z's attitudes towards sustainable food products.**

3.2.3 Consumer Attitude and Purchase Intention towards Sustainable Food Products

According to the Theory of Reasoned Action, an individual's motivation (intention) to carry out a recommended conduct rises when they have a favorable attitude toward it (Ajzen, 1985). Many researches have shown that attitudes relate to purchase intention towards sustainable food products positively. Positive attitudes toward sustainable food items are likely to lead to greater purchasing intentions from Millennials and Generation Z in Indonesia. Consequently, the purpose of this study is to demonstrate how these factors relate to one another, which gives rise to the following hypothesis:

H3. **Millennials and Generation Z individuals in Indonesia with positive attitudes towards sustainable food products will exhibit higher intentions to purchase them.**

3.2.4 Family and Friends Opinion and Social Pressure

Although there are several sources of social pressure (Ashforth & Mael, 1989), the researcher chose the opinions of family and friends as one type of social pressure that Millennials and Generation Z perceive. Despite being labeled as Social Media Generations, Millennials and Generation Z are social beings who still value the views of those in their immediate social circle. However, the way of perceiving opinions might be different from previous generations. An individual's perceived social pressure to purchase sustainable food goods will be significant if family and friends consistently express the belief that eating sustainable food items is an essential decision. Drawing from the previously mentioned information, the author proposed the subsequent hypothesis:

***H4.* The opinions of family and friends on sustainable foods positively influence social pressure experienced by Millennials and Generation Z in Indonesia.**

3.2.5 Media Influence and Social Pressure

Because information is readily available through a number of media means in the contemporary digital era, the influence of media on the buying habits of consumers has garnered attention in research and conversation. The agenda-setting theory (McCombs and Shaw, 1972) holds that the media greatly influences how people perceive the world and focus their attention on particular projects or individuals. Sustainable food products, characterized by their eco-friendly production methods, ethical sourcing, and positive environmental impact, have gained substantial attention as consumers increasingly recognize the importance of their choices in fostering sustainable practices (Indriani *et al.*, 2019). Within this context, understanding the intricate dynamics between media influence and social pressure concerning the purchase of sustainable food products becomes paramount. Media, encompassing television, social media platforms, online articles, and advertisements, serves as a powerful tool for disseminating societal norms and expectations. Therefore, the higher the media influence leads to higher social pressure. This relationship is stated in the hypothesis below:

***H5.* The influence of mass media about sustainable foods positively affects social pressure experienced by Millennials and Generation Z in Indonesia.**

3.2.6 Social Pressure and Purchase Intention towards Sustainable Food Products

Social pressure can influence purchase intentions in Indonesia, particularly among Millennials and Generation Z who are highly influenced by their social circles and societal expectations. The relationship between social pressure and consumer behavior, specifically regarding sustainable food products, is complex yet significant (Hasan & Suciarto, 2020). Perceived social pressure indicates that individuals are acutely aware of the expectations and opinions of their social circles regarding sustainable consumption. When this social pressure is positive, it often leads to a strong intention to align one's purchasing behavior with the prevailing social norms and expectations. In the context of Millennials and Generation Z in Indonesia, this relationship gains particular importance due to the unique socio-cultural landscape of the country. As these generations navigate traditional values alongside global influences, their purchasing intentions are profoundly affected by the social pressures exerted by family, friends, and society. Perceived social pressure from the closely related acquaintances or the media towards purchasing sustainable food products will support Millennials and Generation Z in purchasing them. So, the last hypothesis was developed:

***H6.* Perceived social pressure positively correlates with the purchasing intentions of sustainable food products among Millennials and Generation Z in Indonesia.**

Chapter 4 Research Methods

4.1 Research Objects

This study adopts a quantitative research approach utilizing structured questionnaires to collect data through online channels. A cross-sectional survey design is employed to capture the purchasing intentions and related factors among Indonesian Millennials and Generation Z regarding sustainable food products.

- Population: The target population includes Millennials (those born between 1981 and 1996) and Generation Z (those born between 1997 and 2012) residing in various regions of Indonesia.
- Sample Size: A representative sample of 301 participants is selected to ensure statistical reliability.
- Sampling Technique: A stratified random sampling method is employed, targeting two distinct demographic groups: Millennials and Generation Z. It guarantees that the distinctive qualities of each group are adequately represented in the study sample by splitting the overall population into strata (Millennials and Generation Z) and then choosing randomly a sample from every stratum. This method enhances the precision and reliability of the findings within these specific age categories, enabling the research to draw accurate conclusions about the purchasing intentions of sustainable food products among Millennials and Generation Z in Indonesia.

4.2 Questionnaire Design and Content Introduction

This study conducted a thorough investigation of every variable involved and created a theoretical framework to direct the objectives of the study. The overarching methodology can be outlined as follows: Firstly, by leveraging established scales, each variable was deconstructed into distinct dimensions. This facilitated the initial questionnaire design. Subsequently, a preliminary round of data collection took place in a localized setting through a small-scale pre-test. This initial data served as the basis for refining and validating the questionnaire's reliability. After the pre-test, the questionnaire was revised and altered in light of test findings and input from the sample population, resulting in the construction of the final version.

This study's technique of collecting data, a survey with a questionnaire, has been selected. The initial segment focuses on gathering fundamental information about the objects, encompassing details such as their city of residence in Indonesia and year of birth. The 5-point likert scale is used in the questionnaire's main section. Respondents are prompted to select a numerical value between 1 and 5 to convey their opinion on each statement, with 1 signifying "strongly disagree" and 5 indicating "strongly agree." Aligned with the research objectives, the questionnaire is structured into six distinct sections:

1. Introduction. In the introduction part, the purpose of this questionnaire distribution was firstly explained to all respondents and the confidentiality of the data was guaranteed in order to eliminate the respondents' concerns about information leakage.
2. Personal information of the respondents. The main content is the collection of basic demographic information such as city of residence in Indonesia and the year of birth.
3. Measurements for the variables of Environmental Awareness, Awareness about Country Regulations, and Purchase Intention, a total of 9 questions.
4. Measurements for the variables of Attitude towards Sustainable Food Products and Family and Friends Opinion, a total of 8 questions.
5. Measurements for the variables of Media Influence, Social Pressure, and Purchase Intention, a total of 8 questions.
6. After submission. This part includes showing gratitude to the respondent for filling out the questionnaire.

4.3 Variable Measurements

In formulating the measures for the variables examined in this study, an extensive review of established literature informed the construction of pertinent statements. A meticulous process was undertaken, involving the categorization of each variable into distinct degrees. Subsequently, tailored statements were meticulously devised in alignment with the specific objectives of the research. The comprehensive set of specific statements is presented in the tabular format below, detailing the nuanced aspects encapsulated by each variable for a more nuanced exploration.

Table 4.1 Questionnaire Items and Sources

Observed Variable	**Statements Constructed**	**Resource**
Environmental Awareness (EA)	1. I pay attention to current environmental issues 2. I often look for information about the green products 3. I select food products based on environmental concern 4. I view myself as an environmentally conscious consumer	Wang *et al.* (2019), Lestari *et al.* (2020)
Awareness about Country Regulations (RA)	1. I know the existing regulations in my country regarding sustainable food products 2. I am aware of the labeling requirements that regulate the identification of sustainable food products in my country 3. I am familiar with government initiatives aimed at promoting the consumption of sustainable food products	Zhao *et al.* (2023)
Attitude towards Sustainable Food Products (AT)	1. Sustainable food products is affordable 2. Sustainable food products is easy to find 3. Consuming sustainable food products is interesting 4. Consuming sustainable food products is important 5. Consuming sustainable food products is beneficial	Lestari *et al.* (2020), Wang *et al.* (2019)
Family and Friends Opinion (FO)	1. My family and friends have positive impressions about sustainable food products 2. My family and friends think consuming sustainable food products is important 3. My family and friends think that I should buy sustainable food products rather than non-sustainable food products	Lestari *et al.* (2020)
Media Influence (MI)	1. Different media channels around me expose information about sustainable food products 2. I follow media channels that discuss sustainable and eco-friendly food choices 3. Many people I follow on the media promote their choices to consume sustainable food products 4. I receive strong influence from the media to consume sustainable food products	Trivedi *et al.* (2018)

Table 4.1 Questionnaire Items and Sources (Continued)

Social Pressure (SP)	1. There are societal expectations to consume sustainable food products 2. Consuming sustainable food products is socially approved and valued 3. I perceive pressure from society to consume sustainable food products	Wang *et al.* (2019)
Purchase Intention (PI)	1. I am willing to try consuming sustainable food products 2. I intend to buy sustainable food products in my next purchase 3. Given a choice, I prefer to consume sustainable food products	Ajzen (1991), Lestari *et al.* (2020)

Chapter 5 Data Analysis

5.1 Data Scale

The survey was conducted online from November 28, 2023 to December 16, 2023. Questionnaires were distributed and a total of 301 responses were obtained. Upon filtering, valid questionnaires were obtained. There were 301 copies and the questionnaire validity rate was 100%.

5.2 Descriptive Statistical Analysis

5.2.1 Sample Statistical Characteristics

Initially, a statistical analysis is conducted on fundamental respondent information, encompassing details such as the city of residence and year of birth. It is imperative to comprehend the contextual landscape of the research, wherein the following aspects are considered:

Table 5.1 Basic Information Characteristics

Variable	Sample Characteristics	Number of Respondents	Data Ratio
City of Residence in Indonesia	West of Indonesia	101	33.6%
	Central of Indonesia	90	29.9%
	East of Indonesia	110	36.5%
Year of Birth	1981 - 1996	119	39.5%
	1997 - 2012	182	60.5%

The data presented in the table indicates a predominant concentration of respondents residing in the eastern part of Indonesia, constituting a majority at 36.5%. The rest of the respondents are located in the west of Indonesia (33.6%) and the central part of Indonesia (29.9%). Furthermore, the breakdown of respondents by generational cohorts reveals that Millennials account for 39.5%, while Generation Z represents a larger proportion at 60.5%. This distribution sheds light on the geographical and generational diversity within the respondent pool.

5.2.2 Descriptive Analysis of Each Variable

This study conducted descriptive statistical analysis on each variable. The standard deviation of each variable in this study is less than 2, which suggests that the collected data is stable and suitable for more research, according to the data analysis findings. The detailed findings are outlined below:

Table 5.2 Descriptive Statistical Analysis of Each Variable

Variable	N	Mean	Standard Deviation
Environmental Awareness	301	3.68	1.06
Awareness about Country Regulations	301	3.57	1.22
Family and Friends Opinion	301	3.78	1.06
Media Influence	301	3.55	1.16
Attitude towards Sustainable Food Products	301	3.85	1.05
Social Pressure	301	3.65	1.08
Purchase Intention	301	3.96	1.02

5.3 Measurement Model Analysis (Outer Model)

The objective of the Outer Model Test is to determine if the research tool can meet the requirements for high-quality research data, which are defined by validity and reliability. While the reliability test attempts to assess measurement consistency when the same indicator is used again, the validity test is intended to determine the correctness of an indicator in a study variable.

5.3.1 Convergent Validity Test

Examining the outer loading values for each construct indicator is part of determining the validity of indicators using the SmartPLS application. The Rule of Thumb states that convergent validity is assessed when outer loading values are greater than 0.7. The Average Variance Extracted (AVE) values serve as an additional measure of convergent validity in addition to outer loading. The AVE value must be above 0.5 in order to satisfy the adequacy criterion. The findings of the convergent validity are shown in Table 5.3.

Table 5.3 Outer Loading Value

Construct	Item	Outer Loading	Evaluation
Environmental Awareness (EA)	EA1 EA2 EA3 EA4	0.787 0.878 0.840 0.871	Valid Valid Valid Valid
Awareness about Country Regulations (RA)	RA1 RA2 RA3	0.914 0.908 0.898	Valid Valid Valid
Family and Friends Opinion (FO)	FO1 FO2 FO3	0.886 0.903 0.888	Valid Valid Valid
Media Influence (MI)	MI1 MI2 MI3 MI4	0.886 0.883 0.889 0.891	Valid Valid Valid Valid
Attitude towards Sustainable Food Products (AT)	AT1 AT2 AT3 AT4 AT5	0.808 0.766 0.838 0.775 0.764	Valid Valid Valid Valid Valid
Social Pressure (SP)	SP1 SP2 SP3	0.894 0.814 0.843	Valid Valid Valid
Purchase Intention (PI)	PI1 PI2 PI3	0.862 0.854 0.884	Valid Valid Valid

The results of the outer loading test show that every item of the constructs has an outer loading value greater than 0.7. This suggests that every indication has met the requirements for convergent validity with success. The Average Variance Extracted (AVE) values are examined once the convergent validity test based on the outer loading values is finished. After utilizing the SmartPLS program for data processing, the AVE values are displayed in Table 5.4 as follows.

Table 5.4 AVE Value Results

Construct	AVE	Evaluation
Environmental Awareness (EA)	0.714	Valid
Awareness about Country Regulations (RA)	0.822	Valid

Table 5.4 AVE Value Results (Continued)

Family and Friends Opinion (FO)	0.796	Valid
Media Influence (MI)	0.787	Valid
Attitude towards Sustainable Food Products (AT)	0.625	Valid
Social Pressure (SP)	0.724	Valid
Purchase Intention (PI)	0.752	Valid

Table 5.4 shows that all variables have an AVE value ≥0.5. The greatest AVE value is 0.822 for awareness about country regulations, while the lowest AVE value is 0.625 for attitude towards sustainable food products. The AVE values fulfill the minimum AVE value criterion of 0.5 since they meet the specified parameters. As such, these items are considered appropriate for use as indicators of the variables in this research.

5.3.2 Discriminant Validity Test

The advice made by Fornell and Larcker that the square root of AVE for each construct should be greater than the bivariate correlations between that construct and all other constructs was followed in assessing the discriminant validity between the constructs. The findings of the discriminant validity test, which was conducted using SmartPLS version 4, are shown in Table 5.5.

Table 5.5 Fornell-Larcker Criterion Results

	Attitude towards Sustainable Food Products	**Awareness about Country Regulations**	**Environmental Awareness**	**Family and Friends Opinion**	**Media Influence**	**Purchase Intention**	**Social Pressure**
AT	0.891						
RA	0.711	0.907					
EA	0.806	0.797	0.875				
FO	0.836	0.749	0.800	0.892			

Table 5.5 Fornell-Larcker Criterion Results (Continued)

MI	0.777	0.808	0.852	0.790	0.887		
PI	0.857	0.655	0.789	0.763	0.705	0.867	
SP	0.807	0.780	0.808	0.810	0.849	0.697	0.851

Table 5.5's interconstruct correlation matrix demonstrates that all scales' discriminant validity was also sufficient since the primary diagonal components, square roots of AVE, outperformed non-diagonal elements in the same row or column (bivariate correlations).

5.3.3 Reliability Test

In order to determine the accuracy, consistency, and precision of the equipment used to measure structures, reliability tests are utilized. Examining the Cronbach's Alpha value and the Composite Reliability (CR) are both part of the reliability examination. Good internal consistency is indicated by a Cronbach's Alpha value more than 0.6 and Composite Reliability ratings for every construct more than 0.7. The values for Cronbach's Alpha and Composite Reliability are shown in Table 5.6.

Table 5.6 Cronbach’s Alpha and Composite Reliability Value Results

Construct	Cronbach’s Alpha	Composite Reliability	Evaluation
Environmental Awareness (EA)	0.865	0.909	Reliable
Awareness about Country Regulations (RA)	0.892	0.933	Reliable
Family and Friends Opinion (FO)	0.872	0.921	Reliable
Media Influence (MI)	0.910	0.937	Reliable
Attitude towards Sustainable Food Products (AT)	0.850	0.893	Reliable
Social Pressure (SP)	0.808	0.887	Reliable
Purchase Intention (PI)	0.835	0.901	Reliable

The results, as presented in Table 5.6, demonstrate that every variable has a Cronbach's Alpha value greater than 0.6 and a Composite Reliability value greater than 0.7. This suggests that the instruments used to gauge these factors are considered to be reliable.

5.4 Structural Model Analysis (Inner Model)

The structural model, also known as the inner model, is tested in order to determine and classify the connections between latent variables.

5.4.1 Collinearity Assessment

It is crucial to check for collinearity in the structural model before beginning any investigations. In the event that the predictor constructions exhibit significant collinearity, the predicted route coefficients might become biased. When there is an abnormally high amount of collinearity, as usually indicated by a Variance Inflation Factor (VIF) value more than 5, it is better to eliminate one of the associated indicators. Table 5.7 displays the values of the VIF.

Table 5.7 Variance Inflation Factor (VIF) Value Results

Construct	Item	Collinearity Statistics (VIF)
Environmental Awareness (EA)	EA1 EA2 EA3 EA4	1.739 2.501 2.301 2.371
Awareness about Country Regulations (RA)	RA1 RA2 RA3	2.794 2.742 2.441
Family and Friends Opinion (FO)	FO1 FO2 FO3	2.325 2.574 2.174
Media Influence (MI)	MI1 MI2 MI3 MI4	2.768 2.633 2.754 2.842
Attitude towards Sustainable Food Products (AT)	AT1 AT2 AT3 AT4 AT5	2.310 2.089 2.110 2.184 2.172
Social Pressure (SP)	SP1 SP2 SP3	2.250 1.568 1.892
Purchase Intention (PI)	PI1 PI2 PI3	1.892 1.857 2.156

Table 5.7 presents the results, which show that all constructions have VIF values less than 5, which means that there are no problems with collinearity.

5.4.2 Coefficient of Determination (R^2)

To evaluate the degree to which exogenous latent factors impact endogenous latent variables, the R-Square measure is utilized. The degree of predictive accuracy is shown by R-Square values, which range from 0 to 1. Higher values denote more accurate predictions. For endogenous constructs, R-Square values exceeding 0.75, 0.50, or 0.25 are often regarded as considerable, moderate, and weak, respectively. Table 5.8 displays the results of the R-square values for each endogenous variable.

Table 5.8 R-Square Value Results

Variable	R-square	R-square Adjusted
Attitude towards Sustainable Food Products	0.662	0.660
Social Pressure	0.772	0.770
Purchase Intention	0.734	0.732

Attitude toward Sustainable Food Products and Purchase Intention show a moderate R-square value of 0.662 and 0.734, respectively, according to the R-square analysis. These values reflect 66.2% and 73.4% of the variation in the measure. Social Pressure has a high R-square value (0.772), meaning that the cumulative effect of exogenous factors accounts for 77.2% of the variation in Social Pressure, with unknown variables accounting for the remaining 22.8%.

5.4.3 Effect Size (f^2)

In addition to looking at the R-square values of each endogenous construct, the change in the R-square value that happens when one exogenous construct is taken out of the model might reveal how important the impact of that exogenous construct is on the endogenous constructs. Researchers refer to this metric as the f^2 impact size. The exogenous latent variable's minor, medium, and large impacts are indicated by thresholds of 0.02, 0.15, and 0.35, respectively, which serve as the basis for the interpretation criteria for f^2 values. Table 5.9 presents the f^2 values.

Table 5.9 f^2 Value Results

	AT	**RA**	**EA**	**FO**	**MI**	**PI**	**SP**
Attitude towards Sustainable Food Products (AT)						0.934	
Awareness about Country Regulations (RA)	0.038						
Environmental Awareness (EA)	0.465						
Family and Friends Opinion (FO)							0.225
Media Influence (MI)							0.508
Purchase Intention (PI)							
Social Pressure (SP)						0.000	

Table 5.9 shows the importance of the relationships between the proposed variables. Awareness of Country Regulations and Environmental Awareness show a small (0.038) and large (0.465) influence on Attitude towards Sustainable Food Products. Family and Friends Opinion and Media Influence show a medium (0.225) and large (0.508) influence on Social Pressure. Attitudes towards Sustainable Food Products show a large influence on Purchase Intention with an effect size of 0.934. However, Social Pressure was found to have no effect on Purchase Intention.

5.5 Hypothesis Verification

Employing SmartPLS version 4.00 software, partial least squares structural equation modeling (PLS-SEM) was used for this study to assess the overall explanatory power of the proposed framework as well as the path significance and magnitude of each of the proposed effects. Because PLS requires less sample size and does not require the data to have a multivariate normal distribution, it was preferred over covariance-based SEM techniques.

5.5.1 Path Coefficient Test

In this section, the gathered data was entered into the PLS software, and path significances were calculated via the Bootstrapping resampling approach with 1000 subsamples and the PLS-

SEM Algorithm. To examine the important variables impacting Indonesian Millennials and Generation Z's intention to purchase sustainable food products and test the proposed hypotheses, PLS-SEM Algorithm and Bootstrapping are used. The research model's influential factors are substituted for analysis, and the findings of the structural model analysis and hypothesis testing are displayed in Figure 5.1 and Table 5.10.

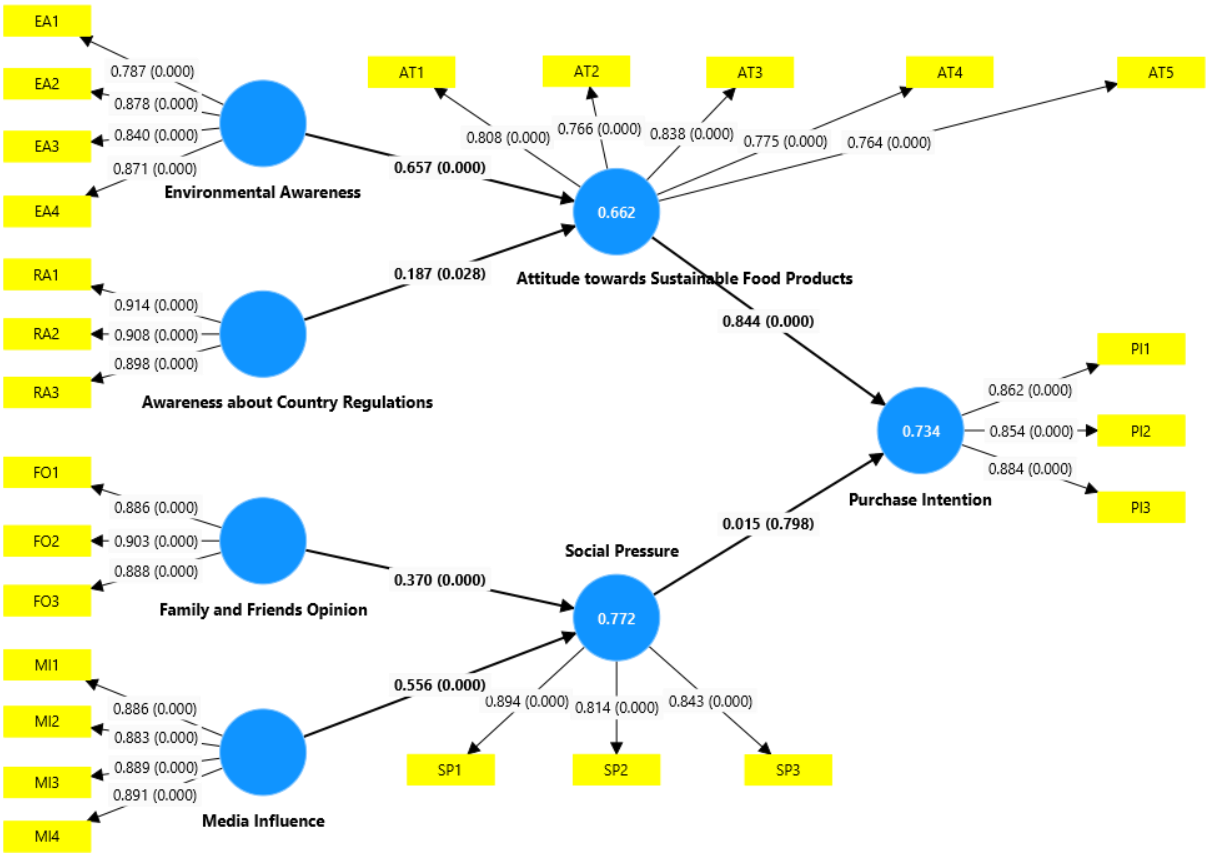

Figure 5.1 Structural Model Analysis Results

Table 5.10 Correlation Coefficients Results

Hypothesis	Path	Original Sample (O)	Path Coefficients	P Values	Result
1	Environmental Awareness → Attitude	0.844	0.657	0.000	Supported
2	Awareness about Country Regulations → Attitude	0.187	0.187	0.024	Supported
3	Attitude → Purchase Intention	0.657	0.844	0.000	Supported
4	Family and Friends Opinion → Social Pressure	0.370	0.370	0.000	Supported

Table 5.10 Correlation Coefficients Results (Continued)

5	Media Influence → Social Pressure	0.556	0.556	0.000	Supported
6	Social Pressure → Purchase Intention	0.015	0.015	0.788	Not Supported

Table 5.10 shows that five hypothesized relationships were validated at a $p < 0.05$ significance level based on the path coefficient test, whereas one hypothesis was not supported. Environmental awareness had a robust and statistically significant positive impact on attitude towards sustainable food products ($\beta = 0.657$, $p < 0.05$), confirming Hypothesis 1. Similarly, awareness about country regulations exhibited a weaker but still significant positive influence on attitude towards sustainable food products ($\beta = 0.187$, $p < 0.05$), supporting Hypothesis 2. Together, environmental awareness and awareness about country regulations accounted for 66.2% of the variance in attitudes toward sustainable food products, with environmental awareness being the primary driver. Attitudes also showed a significant positive effect on the purchase intention of sustainable food products ($\beta = 0.844$, $p < 0.05$), confirming Hypothesis 3. Attitudes explained 73.4% of the variance in purchase intention of sustainable food products. Family and friends' opinions exhibited a strong and statistically significant positive effect on social pressure ($\beta = 0.37$, $p < 0.05$), in line with Hypothesis 4. Media influence on social pressure was found to have a stronger and also statistically significant positive impact ($\beta = 0.556$, $p < 0.05$), supporting Hypothesis 5. Together, family and friends' opinions and media influence accounted for 77.2% of the variance in social pressure, with media influence being the primary contributor. However, the effect of social pressure on the purchase intention of Indonesian Millennials and Generation Z toward sustainable food products was found to be not significant, leading to the rejection of Hypothesis 6.

5.6 Summary of Data Analysis

This research studies the influencing factors of consumers' purchase intention of sustainable food products among Millennials and Generation Z in Indonesia. The sample data collected were analyzed using SmartPLS 4. In the established model, six independent variables and one dependent variable were designed, and six hypotheses were created. After analyzing, a total of five out of the six hypotheses proposed in this research are supported, while one is not supported. The results are summarized in Table 5.11.

Table 5.11 Data Analysis Results

Research Hypothesis	**Research Result**
H1: The level of environmental awareness among Millennials and Generation Z in Indonesia positively correlates with their attitudes towards purchasing sustainable food products.	Supported
H2: The level of awareness about country regulations pertaining to sustainable food production and consumption positively correlates with Indonesian Millennials and Generation Z's attitudes towards sustainable food products.	Supported
H3: Millennials and Generation Z individuals in Indonesia with positive attitudes towards sustainable food products will exhibit higher intentions to purchase them.	Supported
H4: The opinions of family and friends on sustainable foods positively influence social pressure experienced by Millennials and Generation Z in Indonesia.	Supported
H5: The influence of mass media about sustainable foods positively affects social pressure experienced by Millennials and Generation Z in Indonesia.	Supported
H6: Perceived social pressure positively correlates with the purchasing intentions of sustainable food products among Millennials and Generation Z in Indonesia.	Not Supported

Based on the data analysis results, it can be concluded that Environmental Awareness and Awareness about Country Regulations play an intermediate role in influencing Attitude towards Sustainable Food Products, which in turn affecting Indonesian Millennials and Generation Z purchasing intentions of sustainable food products. On the other hand, Family and Friends Opinion and Media Influence has proved to have a role in influencing Social Pressure. However, there's no significant role of Social Pressure in leading Indonesian consumers to purchase sustainable food products.

Chapter 6 Conclusion

6.1 Research Findings and Discussions

In this study, four variables were added to the original TRA variables to examine the factors influencing Indonesian consumers' intentions, especially those of Millennials and Generation Z, to consume sustainable food products: environmental awareness, awareness about country regulations, family and friends opinion, and media influence. The effects of attitude and social pressure on purchase intention have already been studied in the relevant literature; however, this study contributed to the growing body of research by extending the TRA model to the setting of the consumption of sustainable food products and accounting for environmental awareness, knowledge of national regulations, opinions from family and friends, and media influence. SmartPLS was utilized in this study to validate the built model and evaluate the data gathered from the sample data. The following findings have been reached after a comprehensive analysis of the hypotheses:

1. **Increased environmental awareness among Millennials and Generation Z in Indonesia leads to more positive attitudes towards buying sustainable food products.**

The hypothesis test findings indicate that there is a positive relationship between customers' attitudes about purchasing sustainable food items and their degree of environmental knowledge. This implies that attitudes for buying sustainable food items will improve with increasing environmental understanding, and customers' intentions to buy will be increased correspondingly. The present discovery is consistent with earlier studies carried out by Saberina and Aprianti (2022), which showed a favorable impact of environmental awareness on attitudes. Thus, it is evident that Millennials and Generation Z's attitudes toward buying sustainable food products in Indonesia are positively influenced by their level of environmental awareness. Consequently, raising Indonesian consumer environmental awareness is crucial to improve consumers' attitudes toward buying sustainable food products.

2. **Increased awareness of country regulations leads Indonesian Millennials and Generation Z to have more positive attitudes toward sustainable food products.**

Upon evaluating the hypotheses, it is discovered that Indonesian Millennials' and Generation Z's attitudes toward sustainable foods are positively correlated with the level of awareness about country regulations pertaining to sustainable food products. This implies that Millennials and Generation Z in Indonesia will have better attitudes toward buying sustainable food

products, and their intention to buy will be strengthened, the more aware they are of national regulations pertaining to the production and consumption of sustainable food products. Therefore, raising consumers' awareness of the regulations in Indonesia is crucial to improve their attitudes toward buying sustainable food products.

While a number of researchers (Lestari *et al.*, 2020; Riskos *et al.*, 2021) have studied the relationship between eco-label and attitudes toward green products, a comprehensive investigation into the relationship between national regulations' awareness and attitudes toward sustainable food products has not yet been carried out. This discovery is anticipated to enrich the research landscape concerning sustainable food products in Indonesia and prompt increased interest in further exploring the effects of awareness regarding country regulations.

3. **Positive attitudes toward sustainable food products drive higher purchase intentions among Millennials and Generation Z in Indonesia.**

The hypothesis test makes use of PLS-SEM, and the findings show a positive relationship between the variable attitudes and the desire to buy sustainably produced food. As a consequence, the research framework can contain the variables attitudes and purchase intention. This study shows that the attitudes of Indonesian Millennials and Generation Z about sustainable foods and their willingness to buy them are positively correlated. This is in line with past research by Najib *et al.* (2021), which discovered that attitudes had a favorable influence on purchase intention. Additionally, it can be said that the degree of attitudes has a noteworthy positive impact on Indonesia's Millennial and Generation Z consumers' purchase intentions regarding sustainable food products; therefore, improving consumer attitudes is crucial to raising consumers' purchase intentions regarding sustainable food products.

4. **Positive opinions about sustainable foods from family and friends lead to increased social pressure among Millennials and Generation Z in Indonesia.**

In the analysis of the purchase intention of sustainable food products, it can be found that the opinions of family and friends on sustainable foods show a positive correlation on the social pressure experienced by Millennials and Generation Z in Indonesia. In other words, the greater the support of family and friends, the greater the social pressure to buy sustainable food products. This finding is in line with a previous research by Lestari *et al.* (2020), which identified the influence of peer pressure from consumer’s closest person. According to the findings of this study, if the perceptions of sustainable food products are good among their family and friends, Indonesia's Millennials and Generation Z will experience increased social pressure to purchase them.

5. **Increased media influence on sustainable foods leads to greater social pressure among Millennials and Generation Z in Indonesia.**

Testing the theories reveals a strong positive association between media coverage of sustainable food products and the social pressure that Generation Z and Millennials experience to purchase them. This implies that Indonesia's Generation Z and Millennials are under increasing societal pressure to buy sustainable food items the more the media promotes sustainable food products. The present discovery is consistent with other investigations carried out by Trivedi *et al.* (2018), demonstrating a favorable impact of media coverage on consumers' environmental consciousness. Consequently, it can be said that the degree of media influence of sustainable foods positively affects Indonesia's Millennial and Generation Z social pressure to buy sustainable food products; hence, it is crucial to raise media coverage in order to boost this social pressure.

6. **Perceived social pressure doesn't affect the purchasing intentions of sustainable food products among Millennials and Generation Z in Indonesia.**

According to the results of the hypothesis verification, Indonesian Millennials and Generation Z have no evident intention to purchase sustainable food items when it comes to the variable of societal pressure. This finding contradicts study by Vindigni *et al.* (2002), which discovered that social influences positively impacted the tendency of customers to purchase organic food. The author primarily examines an angle to explain why social pressure has no significant impact on customers' intentions to buy. The underlying cause of the issue is because sustainable food products are still emerging in Indonesia, and there isn't much of an urge to consume them. Due to the low level of societal pressure, purchase intentions for sustainable food items are not greatly impacted. Nevertheless, the author recommends conducting additional research and thorough analysis to explore the associations between social pressure and the purchase intentions of sustainable food products among Millennials and Generation Z in Indonesia.

6.2 Suggestions

6.2.1 Recommendations for Sellers

The results can provide Chinese marketers and sellers with some useful information. According to the research, attitudes toward sustainable food products are strongly influenced by environmental awareness, and this has a beneficial impact on Indonesian Millennials and Generation Z's purchase intentions of sustainable food products. In order to boost customers'

purchase intentions and foster a good attitude toward sustainable food products, Chinese sellers can raise Indonesian consumers' environmental awareness. Furthermore, the study highlights the noteworthy influence of family and friends' opinions as well as media influence on shaping social pressure towards sustainable food products among Millennials and Generation Z in Indonesia. It is evident that enhancing the positive perception of sustainable food products among family and friends, and leveraging media channels effectively, are pivotal steps towards bolstering social pressure in favor of sustainable choices. The following are the particular recommendations:

1. Actively Engage in Consumer Education

   Chinese sellers should actively participate in consumer education, offering insights into the sustainability of their processes and products, in order to raise Indonesian consumers' understanding of environmental issues. They may assist Indonesian customers in making decisions that are consistent with their beliefs by providing information through interactive platforms, internet content, and in-store signage. Raising knowledge of the issues facing the environment globally and the ways that personal decisions might support more sustainability goals are also included in this educational endeavor.

2. Provide Transparency and Certification

   One of the main pillars of vendors' sustainability initiatives is transparency. In the modern day, Chinese sellers ought to adopt a more open approach, including thorough information on the product's place of origin, method of manufacture, and impact on the environment. This is due to the fact that greenwashing may erode Indonesian consumer trust. Blockchain and other digital technologies can facilitate this transparency by letting Indonesian consumers track a product's journey from the maker to the store shelf. In order to strengthen Chinese businesses' claims about sustainability and increase their influence, vendors have to acquire certifications from respected bodies. Adopting these certifications will give Chinese vendors a competitive advantage as well as a reliable, unambiguous sustainability indication for Indonesian customers.

3. Create Partnerships

   Partnerships with NGOs and advocacy groups may give Chinese vendors access to conservation initiatives and knowledge about sustainable practices, boosting their sustainability credentials and allowing them to support international environmental

goals. These collaborations have the potential to raise Indonesian consumer awareness of environmental improvement initiatives.

4. Create a Customer Referral Program

   Chinese sellers can effectively enhance Indonesian family and friends' opinions about sustainable food products by implementing a customer referral program, which can also lead to an increase in social pressure. Through a referral program, Chinese sellers incentivize existing Indonesian customers to advocate for their products by referring them to friends and family. This strategy not only encourages Indonesian customer loyalty but also extends the reach of sustainable food products to new audiences. As existing Indonesian customers share their positive experiences with their social circles, they inherently influence the opinions of their family and friends, which results in a higher social pressure towards sustainable food products. This organic dissemination of information creates a ripple effect, as more individuals become exposed to the benefits and values of sustainable food choices.

5. Engage in Influencer Marketing

   Through influencer partnerships, Chinese marketers can leverage the credibility and reach of influencers who resonate with the target audience and advocate for sustainability. By collaborating with influencers who share values aligned with sustainable living, Chinese sellers can effectively communicate the benefits and importance of choosing sustainable food products to a wider audience in Indonesia. As influencers endorse and showcase these products to their followers through authentic and relatable content, they inherently influence their followers' opinions and increase the social pressure to sustainable food products.

6.2.2 Recommendations for Policymakers

The results can provide local policymakers with some useful information. The findings of this study suggest that understanding of national laws pertaining to sustainable food items, which have a big influence on consumer attitudes, could increase purchase intention. Therefore, promoting environmentally conscious behaviors among Indonesia's Generation Z and Millennials depends on raising understanding of the laws governing sustainable food production and consumption. Furthermore, media influence is proved to have a significant impact on social pressure, which means that increasing media influence results in a higher social pressure. The following are the particular recommendations:

1. Make Use of Social Media

   Social media impact is one quick and simple way for politicians to immediately reach a big audience. It will be advantageous to use social media to increase awareness of the regulations controlling the production and consumption of sustainable food, given the extensive use of social media by Indonesian Millennials and Generation Z. It is feasible for legislators to produce engaging and instructive content, including movies, infographics, and blog posts, that explains the objectives and results of legislation. By leveraging the media influence, policymakers in Indonesia will also gain the impact of increasing social pressure towards sustainable food products.

2. Provide Incentives and Rewards

   In order to achieve short-term objectives of raising consumer knowledge of national rules, incentives and prizes might be implemented at the early phases of establishing regulations. Rewards and incentives draw individuals in and compel them to focus more intently on the information being presented regarding rules. When there is a chance of reward or advantage, consumers in Indonesia are more willing to put in the time and effort to learn about the regulations.

6.2.3 Recommendations for Researchers

According to the study's findings, social pressure for sustainable food items is positively impacted by the opinions of family, friends, and the media. However, the influence of social pressure on Indonesian Millennials' and Generation Z's buying intentions toward sustainable food items is not captured by this research. Consequently, it is advised that researchers look into the relationships between the factors of social pressure and Indonesian Millennials' and Generation Z's purchasing intention further. Based on the limitations identified in the research, several recommendations are proposed for researchers conducting future studies in this area:

1. Expand Sample Size and Diversity

   The goal of future research should be to conduct larger-scale surveys with a more diversified participant pool in order to overcome the limitations of a restricted sample size. This can improve the generalizability of the results to a larger population by capturing a greater diversity of viewpoints and experiences. To guarantee proper representation, researchers can think about focusing on particular demographic groups or geographical areas.

2. Employ Mixed-Methods Approach

   Researchers can employ a mixed-methods strategy that blends quantitative surveys with qualitative interviews or focus groups to lessen the drawbacks of online surveys and data quality. With the use of this hybrid method, participants' attitudes, actions, and motives may be better understood, leading to a more thorough knowledge of their purchase intentions for sustainable food items.

3. Explore Additional Variables

   Future study should examine additional variables beyond those included in the current research model, given the complexity of factors impacting purchasing intention towards sustainable food items. This can entail looking into situational, psychological, or sociocultural impacts on consumer decision-making in relation to sustainable food consumption.

4. Continuously Refine Research Model

   The study model should be updated and improved on a regular basis to take into account fresh information, new trends, and shifting consumer preferences for sustainable food consumption. By refining the model iteratively, researchers can make sure that it is still relevant and applicable when dealing with the possibilities and difficulties that the field faces today.

6.3 Research Limitations and Future Prospect

6.3.1 Limitations of the Research Sample and Method

The scope of the survey in this research was primarily constrained by capacity, resources, and time limitations. The limitations of the research sample include the relatively small sample size, which may not adequately represent the broader population due to its limited scope. With a smaller number of respondents, there is a risk of not capturing diverse perspectives and experiences, potentially impacting the generalizability of the findings. Additionally, conducting the survey online introduces limitations in terms of data quality, as respondents might be influenced by various external factors that could influence their responses, such as distractions or biases inherent in online environments. Thus, to address the limitations of the research model, future studies could consider employing a more comprehensive approach that integrates multiple research methods and incorporates a broader range of variables to provide a more holistic understanding of purchase intention towards sustainable food products.

6.3.2 Limitations of the Research Model

While this research constructed a model based on a synthesis of existing literature and the characteristics of sustainable food products, the research model is limited with its potential inability to encompass all factors influencing purchase intention comprehensively. While the model may capture significant variables, it may overlook other influential factors that could affect purchasing decisions. This limitation suggests that the research model may not provide a complete understanding of the complex dynamics at play in determining purchase intention. As a result, there could be unexplored variables or interactions that were not accounted for in the model, leading to gaps in the analysis. Additionally, the PLS-SEM findings indicate that there is sufficient space to improve the explanatory power of the factors related to purchase intentions that are suggested in this study. As sustainable food product development in Indonesia progresses, additional influencing factors are expected to emerge. Therefore, future research efforts should focus on enriching and refining the model to enhance its scientific validity and comprehensiveness.

Acknowledgement

As I approach the end of my university journey, I am grateful for the valuable lessons learned and the support received from my teachers, classmates, and loved ones. I extend my sincere appreciation to my supervisor for his guidance and expertise in shaping my research endeavors. His insightful feedback and patient assistance significantly enhanced my understanding of academic research methods and standards. I am also thankful to the individuals who contributed to my research by completing questionnaires and actively participating, including family, friends, classmates, and strangers. Their invaluable input laid the foundation for the scientific rigor of my study.

Additionally, I express gratitude to my alma mater for providing an enriching academic environment conducive to scholarly pursuits. I am indebted to all the teachers within my major for their mentorship, which has equipped me with a comprehensive understanding of business principles and invaluable life lessons. With profound gratitude, I carry forward the knowledge and lessons learned, aiming to apply them in my future endeavors and contribute meaningfully to society.

Appendix

Exploring Purchasing Intentions of Sustainable Food Products among Millennials and Generation Z in Indonesia

Hello!

I'm Jennifer Tanujaya, a student majoring in International Business at Zhejiang Gongshang University. I am currently conducting a survey regarding consumer interest in purchasing sustainable food products, such as organic food products and food products with recyclable packaging. This survey targets Millennials and Generation Z in Indonesia. If you fall within these criteria, please fill out this survey based on your own experience. The survey will take approximately 5 minutes. Thank You!

All information collected from this survey will be kept confidential. This survey will only be used for research purposes.

Part One: Personal Information

1. City of Domicile in Indonesia (Short Answer)*

   _____

2. Year of Birth (Single-Choice Question)*
   - 1981 - 1996
   - 1997 - 2012

Part Two: Awareness of the Environment and Country Regulations

This section will provide several answer options. You can choose the answer that **best describes** you. There are no right or wrong answers to any of these choices.

Description of answer choices:

1 = Strongly Disagree

2 = Disagree

3 = Between Disagree and Agree

4 = Agree

5 = Strongly Agree

No.	Statements	1	2	3	4	5
1.	I pay attention to current environmental issues*	○	○	○	○	○
2.	I often look for information about the green products*	○	○	○	○	○
3.	I select food products based on environmental concern*	○	○	○	○	○
4.	I view myself as an environmentally conscious consumer*	○	○	○	○	○
5.	I know the existing regulations in my country regarding sustainable food products*	○	○	○	○	○
6.	I am aware of the labeling requirements that regulate the identification of sustainable food products in my country*	○	○	○	○	○
7.	I am familiar with government initiatives aimed at promoting the consumption of sustainable food products*	○	○	○	○	○
8.	I intend to buy sustainable food products in my next purchase*	○	○	○	○	○
9.	Given a choice, I prefer to consume sustainable food products*	○	○	○	○	○

Part Three: Attitude towards Sustainable Food Products

This section will provide several answer options. You can choose the answer that **best describes** you. There are no right or wrong answers to any of these choices.

Description of answer choices:

1 = Strongly Disagree

2 = Disagree

3 = Between Disagree and Agree

4 = Agree

5 = Strongly Agree

No.	Statements	1	2	3	4	5
1.	Sustainable food products is affordable*	○	○	○	○	○
2.	Sustainable food products is easy to find*	○	○	○	○	○
3.	Consuming sustainable food products is interesting*	○	○	○	○	○
4.	Consuming sustainable food products is important*	○	○	○	○	○
5.	Consuming sustainable food products is beneficial*	○	○	○	○	○
6.	My family and friends have positive impressions about sustainable food products*	○	○	○	○	○
7.	My family and friends think consuming sustainable food products is important*	○	○	○	○	○
8.	My family and friends think that I should buy sustainable food products rather than non-sustainable food products*	○	○	○	○	○

Part Four: The Influence of Media and Society

This section will provide several answer options. You can choose the answer that **best describes** you. There are no right or wrong answers to any of these choices.

Description of answer choices:

1 = Strongly Disagree

2 = Disagree

3 = Between Disagree and Agree

4 = Agree

5 = Strongly Agree

No.	Statements	1	2	3	4	5
1.	Different media channels around me expose information about sustainable food products*	○	○	○	○	○
2.	I follow media channels that discuss sustainable and eco-friendly food choices*	○	○	○	○	○
3.	Many people I follow on the media promote their choices to consume sustainable food products*	○	○	○	○	○
4.	I receive strong influence from the media to consume sustainable food products*	○	○	○	○	○
5.	There are societal expectations to consume sustainable food products*	○	○	○	○	○
6.	Consuming sustainable food products is socially approved and valued*	○	○	○	○	○
7.	I perceive pressure from society to consume sustainable food products*	○	○	○	○	○
8.	I am willing to try consuming sustainable food products*	○	○	○	○	○

After Submission

Thank you for taking the time to complete the survey for this research study. Your valuable insights and responses will make a significant contribution to understanding Purchasing Intention of Sustainable Food Products in Indonesia.

Warm regards,
Jennifer Tanujaya
